SUMMARY

I build automation systems that save businesses hours of manual work — from web scraping and API integrations to AI-powered workflows. Day-to-day I work in Python and FastAPI; on the side I'm shipping AI agent experiments and hackathon prototypes to grow into AI engineering. Open to remote roles, freelance projects, and hackathon collaborations.

CORE SKILLS

Automation: Python, web scraping, API integration, data pipelines, ETL, workflow automation

AI & LLMs: OpenAI, LangChain, agents, prompt eval, RAG

Engineering: FastAPI, Postgres, SQL, Next.js, TypeScript, Git

Cloud & Infra: Google Cloud, Railway, Docker basics, Linux, CI/CD

CLIENT WORK

Web scraping systems

Python · Playwright · BeautifulSoup

Scrapers built for clients — handle JS rendering, anti-bot patterns, retries, and clean data export.

Outcome: replace hours of manual data collection per week with one cron job.

API integration systems

Python · FastAPI · Postgres

Small Python services that connect third-party APIs (CRMs, ads, payments) so the client's stack sees one consistent interface.

Outcome: stop juggling 4 dashboards. One source of truth, updated automatically.

PERSONAL PROJECTS

AI KPI Debugger

Python · SQL · APIs

Compares advertising metrics across platforms and surfaces reporting mismatches in real time.

Built to understand cross-source analytics discrepancies that quietly waste ad budget.

AI Agent Experiments

Python · OpenAI · LangChain

Small vertical agents that try to complete real tasks end-to-end — research, data entry, follow-ups.

Learning what LLMs can actually do in production, outside the demo bubble.

Google Cloud Hackathon Build

Google Cloud · Python · AI

AI + cloud-native prototype in development for an upcoming Google Cloud hackathon.

Pressure-test what I can ship in a weekend with real infra.

JOURNEY

Python Automation Developer — Freelance & indie builds

2026

Mexico City · Remote

- Helping businesses automate repetitive work with web scraping, API integrations, and data pipelines.

- Prototyping for AI + cloud hackathons (Google Cloud focus).
- Shipping AI agent experiments and documenting the process publicly.

First revenue experiments

2025

Side bets · Self-directed

- Tested small products and content experiments to learn what people actually pay for.
- First paid automation projects.

Started building online

2024

Self-taught

- Began shipping small tools, automations, and side projects.
- Got hooked on the build-publish-learn loop.

GOAL

Build a company that solves real problems and gives me the freedom to work from anywhere — starting with the automations and AI tooling I'm shipping today.
